Conditional NFs – Conditional Sampling

We can sample directly from the posterior

Conditional NFs – Training

Train network to normalize joint samples.

We concat (y, x) so training objective is exactly the same:

$$\min_{\theta} \frac{1}{N} \sum_{(\mathbf{x}, \mathbf{y}) \in D_{train}} \left[\frac{1}{2} ||T_{\theta}(\mathbf{y}, \mathbf{x})||_{2}^{2} - \log |\det \nabla_{y, x} T_{\theta}(\mathbf{y}, \mathbf{x})| \right].$$
